

# Zscaler™ Client Connector

A single app that supports all leading mobile operating systems, including laptops.

Zscaler Client Connector (formerly Zscaler App/Z App) delivers security for all of your remote users, regardless of device type or OS. With Zscaler, you can enable security policies that truly follow the user, without the hassle of managing different agents or PAC files on different endpoints.

## BENEFITS

- Policies follow users wherever they go
- Policy changes are enforced immediately, worldwide
- App usage is enforced; Client Connector can't be removed, even if the user is an administrator
- Tunneling can be configured to turn off automatically when on a trusted network

Client Connector is a single app that supports all leading mobile operating systems, including laptops.

## SUPPORTED SYSTEMS

- iOS 9 or later
- Android 5 or later
- Windows 7 and later
- Mac OSX 10.10 and later

Enterprises today must contend with their employees' desire for fast and simple mobile Internet access. And it's not just road warriors any more—the need for speed and simplicity reaches every employee in the company, having been fostered by the growing use of cloud and software-as-a-service solutions.

While these solutions have been a real boon to productivity, they also, unfortunately, have caused some users to bypass security controls and go direct to the Internet.

In an effort to prevent security breaches brought about by mobility, some companies use proxy auto-config (PAC) files, and, while they provide protection in the use of browsers, they don't secure native application traffic. VPNs are also used, but no one uses VPN to access the Internet and cloud applications.

In response to the increase in mobile traffic, solutions like mobile device management (MDM) surfaced, but while MDM is great for managing mobile devices, it doesn't protect users from cyberthreats.

## Enter Zscaler

Client Connector, a part of the Zscaler Cloud Security Platform, brings the highest level of security and compliance to mobile users, along with a seamless experience. Client Connector automatically creates a lightweight HTTP tunnel from the user's device to the Zscaler Cloud Security Platform, where policy is enforced and all traffic—including traffic from native apps—is inspected for malicious content. This all happens in the cloud, not on the device, so malicious content doesn't reach the mobile device or corporate network. And, with Client Connector, there's no need for PAC files, an IPsec VPN, authentication cookies, or any extra end-user steps.

With Zscaler, protection and policy follow users wherever they decide to connect. Traffic from Client Connector is always routed to the closest Zscaler data center—one of more than 150 Zscaler data centers around the world—to deliver the fastest and securest path to the internet. The Zscaler platform inspects every byte of traffic to protect against cyberthreats hiding in web content and malicious apps, and to prevent data leakage—all with only microsecond delay.

Getting started with Client Connector is simple. A one-step enrollment process makes deployment easy and, if you're using single sign-on (SSO), you can quickly enable multi-factor authentication. Client Connector supports both auto and managed updates and can be seamlessly integrated with your existing Group Policy Object (GPO) policy.

“The Zscaler deployment was very simple as Zscaler was already 100% integrated with our existing MDM, which made deployment transparent and automatic.”

—SANTA LUCIA

**Detailed fingerprinting enhances visibility and reporting, making it easier to act on information.**

The dashboard provides a comprehensive overview of device management. It includes:

- Zscaler App Licenses:** A bar chart showing 1,000 total licenses, with 1,000 subscribed and 0 used.
- Device Model:** A donut chart showing the distribution of device models, including VMware, Apple, and Parallels.
- Device OS:** A donut chart showing the distribution of operating systems, including Windows 7 Professional, Windows 8.1 Pro, and Windows 7 Ultimate.
- Device Policy Status:** A donut chart showing the status of devices, including Outdated, Updated, Unregistered, and Removal Pending.
- Zscaler App by Platform:** A bar chart showing the number of devices on different platforms: iOS, Android, Windows, and Mac.

Enhanced device-level reporting gives you complete visibility into all user devices, anywhere. You can see details about device, OS, users, and traffic at a glance, and easily drill down to specifics.
